

# Assignment 2

## Group: supreme-broccoli 🏆🥦

First, we use the Kryo Singleton to serialize the message and chunk it subsequently as a List of ByteStrings. Then, we create a Source that is a ByteStream from the serialized message chunks and run it with a sourceRef with help from Akka. Further, this sourceRef is what we send as BytesMessage from one to the other system. The other system can generate a Sink from this sourceRef. This Sink then, again with the help from Akka, can be used to stream the entire message from one system to the other.
